When we used the autograder, most of our classes worked correctly, but a couple of them had errors. We were able to fix an error with the Foundation class regarding how null values are handled, as well as an error in the Cascade class due to the addCard method not being called properly. After fixing these errors, we ran the code using 45 test cases, and it passed all of them. For the CardStack class, we tested whether the new stack was empty, whether the getTopCard method would return null on an empty stack, whether toString would return an empty string and if it was formatted properly, as well as if the top card was the last card that was added. We also tested to make sure it would ignore the addCard method with a null value. Lastly, we tested the playTo method with an empty stack, which returned false. For the Cell class, we tested whether it would accept cards if it wasn't empty. For the Foundation class, we tested whether it would reject a non-ace if it was empty, whether it would accept an ace if it was empty, whether it would reject a card based on its suit and rank, whether it would accept a card that was the same suit and the next rank, and whether you can play from it. For the Cascade class, we tested whether it would accept any card when empty, and then used several specific test cases to check if it would accept cards that alternated in color and descended in rank. One of these cases was a black 5 on a red 6, which was accepted, and a black 7 on a red 6, which was rejected. For FreeCellGame, we tested whether all 52 cards were present, whether the deck was empty after the cards were dealt, the sizes of the cascades, whether it would give a game over and a winning result properly, whether toString was formatted correctly, whether using the getStack method out of range would return null, whether it would allow play from an empty cell or a foundation, and whether it would allow play from a cascade. Each of these test cases passed, but after using the autograder again, we found one remaining error in the CardStack class stating that the canPlayFrom method allows play from an empty stack. We were unable to fix this error.
